a The condition explains most of the work-up and a small share of the text

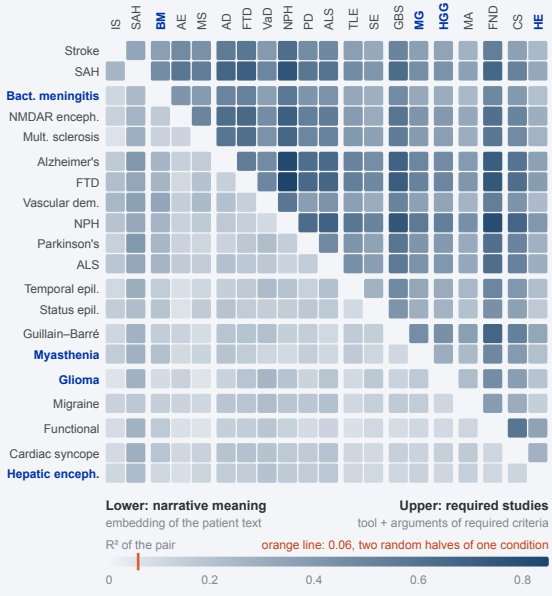

388/438 required studies are specific to one condition

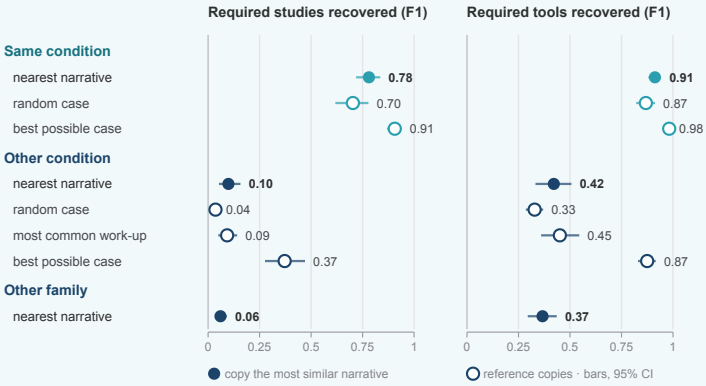

233/237 ordered study pairs are specific to one condition

≤0.011 R^2 of case difficulty, in any view

b Every pair of conditions differs in work-up, much less in text

c A new condition cannot be solved by copying the work-up of a known one

Copying from another condition brings in an action the case's policy lists as to be avoided in **28%** of cases (same condition 3%). Nearest narrative from another condition beats a random case (Wilcoxon over 20 conditions, P = 0.003) but not the most common work-up (P = 0.37).

d The proposed test conditions are among the hardest to copy
